

OCI Terraform Lab 3 | Week 3 Task Checklist

1. Week 3 Objectives

Understand that Week 3 focuses on DevOps/Kubernetes and Terraform modules.

Study the first 9 modules of the DevOps course or the Kubernetes course (both cover the same content).

Skip Modules 6 and 7 for now, as they won't be used in the lab and study them after the lab.

2. Terraform Modules

Create a Subnet Module containing these four resources:

Subnet, Route Table, Security List, and Enable Logs.

Create an OKE Module for creating the OKE cluster and its required components.

Make your modules generic and reusable.

Avoid hardcoding values inside the module code. Values should be passed through variables and adapted from the root configuration.

Research and understand the following Terraform concepts:

Dynamic blocks, conditional expressions, and how to make Terraform modules reusable and configurable.

3. Lab Implementation

Using the modules you created, create an OKE cluster with VCN native pod network and managed worker node pool.

Deploy an application to OKE.

Attach an external block volume to the application.

Expose the application through a Load Balancer.

4. Final Goal

Ensure the overall solution is built in a clean, reusable, and configurable Terraform structure.

The goal is not only to make it work, but to achieve a well-structured and maintainable infrastructure as code.
